^{99m}Tc-DTPA Renal Scan

Clinical History: This is a known case of left renal calculi and PUJ obstruction, status post-DJ stenting (03/05/2026). USG (25/04/2026) marked left hydronephrosis with left renal calculi. CT scan (28/04/2026): enlarged left kidney with moderate to severe hydronephrosis with parenchymal thinning. Serum Creatinine: 0.86 mg/dL. Now for evaluation of the disease status.

Technique:Radio-Pharmaceutical used: ^{99m}Tc - DTPA

Dose: 4.1 mCi

Views Taken: Posterior

Lasix Protocol: F+15

Findings:

	Left Kidney	Right Kidney
% of Contribution	46.96 %	53.04 %
Peaking time	delayed	2.37 minute
Transit time (Max to ½ Max)	Prolonged	8.25 minute
GFR	53.65 ml/min	60.6 ml/min

Total GFR = 114.25 ml/min**Left kidney:**

Appears enlarged in size. Shows good cortical tracer extraction. Progressive radiotracer accumulation seen in the dilated pelvicalyceal system upto post void image, which shows around 40% clearance in delayed 1-hour imaging. Whole kidney peaking time is delayed and intrarenal transit time is prolonged. Renographic curve is of rising pattern of obstruction.

Right kidney:

Appears normal in size and position. Shows normal cortical tracer extraction. Transient pelvicalyceal hold up of radiotracer is seen, which clears promptly post IV lasix administration. Whole kidney peaking time and intrarenal transit time are normal. Renographic curve is of non-obstructed pattern.

LILAVATI HOSPITAL
AND RESEARCH CENTRE

COMMENTS:

- Enlarged, hydronephrotic left kidney with good cortical function and obstructed drainage pattern.
- Normal-sized right kidney with good cortical function and GFR, with non-obstructed drainage.
- Differential function: Left Kidney: 46.96 %; Right Kidney: 53.04 %
- Total GFR: 114.25 ml/min.

MICROBIOLOGY

Blood Culture And Sensitivity: Aerobic Bacteria, Blood *

Method

Automated BACTEC FX¹ Blood Culture System and Automated MicroScan Walkaway Identification & Susceptibility System

Test

Detection of Aerobic Bacteria From Blood

Result

No Growth in culture after 3 days of incubation at 37°C.

Remark

THIS IS FINAL REPORT.

Note

- Culture and susceptibility test results are need to be correlated clinically.
- Previous history of antibiotic usage may influence the growth of microorganisms in vitro.
- The report represents only the specimen received in laboratory.

INTERPRETATION

BACTEC FX is a fully automated continuous monitoring walk away blood culture testing system works on fluorescent sensor technology for rapid detection of microorganism in clinical specimens. **BACTEC-PLUS** culture bottles contains highly enriched medium with resin particles which enhances the growth of microorganism and neutralizes the antibiotics (if present in blood) thus resulting in best positivity rates. When microorganisms are present in culture vials, they metabolize nutrients in the culture medium, releasing carbon dioxide into the medium. A dye in the sensor at the bottom of the vial reacts with CO₂. This modulates the amount of light that is absorbed by a fluorescent material in the sensor. A photo detector at each station measures the level of fluorescence, which corresponds to the amount of CO₂ released by organisms. Then the measurement is interpreted by the system according to pre-programmed positivity parameters.

MICROSCOPY

Gram Stain

Moderate pus cells seen,
Moderate Gram negative bacilli seen.

Remark(s)

Pus cells, epithelial cells & RBC counts are based on direct uncentrifuged specimen and not on the centrifuged sediment.

CULTURE

Colony Count (CFU/ml)

>1,00,000

Organism(s) Isolated

Escherichia coli

mark(s)

The above organism was isolated at the end of 24 hours of incubation at 37°C.
Colony Counts greater than 1,00,000 CFU/ml are considered significant and suggestive of Urinary tract infection.
Colony counts lesser than 1,00,000 CFU/ml should be correlated with clinical findings of the patients.

Note

- Culture and susceptibility test results are need to be correlated clinically.
- Previous history of antibiotic usage may influence the growth of microorganisms in vitro.
- The report represents only the specimen received in laboratory.
- CFU - Colony Forming units.

INTERPRETATION

- For Blood Cultures and for critical care patients' Antibiotic susceptibility test is done using complete Automated Microscan Walkaway 40 System. In manual method, antibiotic susceptibility is done by Kirby-Bauer Disc Diffusion Method. All Results are interpreted in accordance with guidelines of CLSI 2021. Few antibiotics from each group are tested and results are applicable for all those belonging to the group.
- 1st gen. Cephalosporins - Result for this antibiotic is applicable for 1st gen. Cephalosporins e.g. Cephalexin, Cefadroxil, Loracarbef & Cephopodoxime.
- 2nd gen. Cephalosporins - Cefuroxime, Cefactor, Cefprozil, Cefotetan, etc. Interpretative criteria based on the dosage 2g every 8 hours in infections other than uncomplicated UTI's.
- 3rd gen. Cephalosporins - Cefoperazone, Cefazidime, Cefdinir, Ceftriaxone, Cefotaxime, etc. Cefotaxime - Interpretative criteria based on dosage 1 g every 8 hrs & for Ceftriaxone-1g every 24 hrs. Cefazidime - Interpretative criteria based on dosage 1 g/8hrs.
- 4th gen. Cephalosporins - Cefepime, Interpretative criteria based on dosage 1g every 12 hrs.
- 1st gen. Quinolones: Nalidixic acid & Cinoxacin.
- 2nd gen. Fluoroquinolones: Ofloxacin, Ciprofloxacin, Lomefloxacin & Norfloxacin.
- 3rd gen. Fluoroquinolones: Levofloxacin, Sparfloxacin, Gatifloxacin & Moxifloxacin.

MDCT SCAN OF KUB WITH UROGRAPHY (Plain & Contrast)

Plain and contrast enhanced MDCT scan of Abdomen & Pelvis with Urography was performed.

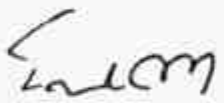

Observations:

- Enlarged left kidney with moderate to severe hydronephrosis in left kidney with moderate to severe parenchymal thinning in left kidney with dilated extrarenal pelvis showing abrupt focal short segment partial narrowing at the left pelviureteric junction. No enhancing mass lesion is seen at the site of narrowing. No surrounding fat stranding. No extrinsic compression of the pelviureteric junction. Immediate post-contrast study shows normal prompt symmetrical enhancement of the thinned left renal parenchyma. 15 minute delayed scan shows Hypo excretion of contrast in the left pelvicalyceal system partially opacifying the left pelvicalyceal system. 30 minute delayed scan reveals excreted contrast opacifying the entire left pelvicalyceal system and extending into the left ureter through the partially narrow left pelviureteric junction. The above imaging features are suggestive of partial left pelviureteric junction obstruction with delayed hypofunctioning left kidney. No perinephric fat stranding or collection is seen. AP dimension of the left renal pelvis measuring 4.5 cm. No abnormal wall thickening of pelvicalyceal system. Lower pole parenchymal thickness in the left kidney measuring 6 mm.
 - Multiple (3) non-obstructing secondary left renal lower calyceal calculi are seen largest measuring 18 x 10 mm of 1250 HU with the other two calculi measuring 12 mm and 8 mm respectively. Tiny left middle calyx calculus seen measuring 4 mm.
 - Extrarenal mildly dilated pelvis is seen in the right kidney without right sided hydronephrosis and no right pelviureteric junction obstruction. AP dimension of right renal pelvis measuring 1.7 cm.
- Right kidney shows normal size, parenchymal thickness, shape and shows normal prompt parenchymal enhancement and excretion.
- There is no evidence of any radio-opaque calculus in right kidney and both ureters. No evidence of any hydronephrosis on right side. No evidence of enhancing mass lesion or cortical scarring.
 - Right kidney measures 10.5 x 5.1 cm while left kidney measures 14 x 7.8 cm.
 - Ureters appear normal in wall thickness, course and caliber. Both vesico-ureteric junction regions appear normal.
 - The urinary bladder is distended . No abnormal wall thickening . No intra-luminal radio-opaque calculus is seen.
 - Prostate gland appears normal in size and enhancement. Seminal vesicles are unremarkable.
 - Rest of the visualized abdomen reveals no significant major abnormality.
